
Feature request - suppress duplicate events

Posted by BenBasson - 2012/05/29 15:09

I have the fortune of using a corporate Google account at work as well as my own personal Google account. An unfortunate restriction on the corporate account is that it is set up so that all events are published as "Private" to anyone they are shared with outside of the company. I cannot alter this, and it likely will not be changed.

My solution when I need to share work events with my friends or parents is to simply duplicate the events into my personal calendar. This all works fine when viewed in Google Calendar, and achieves the intended results, but it does make for a bunch of duplicated entries in the Event List in Rainlendar.

I would quite like the option to suppress the duplicate events (they all have identical text, dates, etc), so that only one shows in the list. Currently the only workaround I have to make the Event List useful in this scenario is to make it much longer.

Thanks for considering my suggestion.

Could you duplicate the entries in a separate or particular calendar? In this way you can exclude this calendar from the options of the Event List window.

Each event has a unique ID, even if they have identical information. To remove duplicates RL will need to read each one and compare it with all the others... (I prefer not to think if there're plenty of events)

Hiding duplicates probably would not require too much work although it would be more or less random which event was left visible. I'll have to think about this. In the mean time you can try the workaround Jorge Luis suggested and create a separate calendar for the duplicated events.
