## rainlendar2 + xcompmgr (compton)

Posted by ichinoeda - 2012/06/01 02:32

---

Hi everybody.

Does somebody know how to get rainlendar play nicely whith xcompmgr or compton?

The main question I have is why does rainlendar not discover that there is a compositing manager (as it does in KDE, Gnome and Xfce) so that I can regulate transparency within the rainlendar options?

Is there a way to tell rainlendar to work with/recognize xcompmgr/compton?

I use openbox with compton (which is an improved xcompmgr). I also know how to make rainlendar transparent but it is not satisfying. When I use transset with devilspie all rainlendar windows are transparent (not just the main window). Using solely transset - rainlendar is not transparent any more after a restart. And both options are not very relyable.

Thanks for suggestions.
