## Import / export settings

---

Hi,

could we get an import / export settings in the main context menu, probably next to "Install the license"? That way, when installing Rainlendar on a new machine / OS, I would not have to remember where the config is stored, not manually copy a file, and not manually restart Rainlendar in order to use the same settings on all machines.

Thanks!

You can import/export settings but not directly from the menu.  
Manager... -> File -> Backup (or Restore)

This will open a dialog to save (or load) the file to (from) any folder. It will backup the calendar files and the config files, but not the skins or addon files.
