## window size an position changes from day to day

Posted by rainyday - 2012/06/28 08:59

---

hi,

i'm using rainlendar lite 2.9 for a few weeks now. nice program, suites my needs.

but: rainlendar comes in 2 different window sizes and -positions on the desktop, that alternate with every systemstart.

due to a systemrecovery i had to install rainlendar a second time, maybe this is how that occurred?

can i fix this? i'm using windows7, 64bit

kind regards  
Frank

I have no idea what you are referring to. Can you post a screenshot which shows the problem?

sorry, it took me a while...

in the meanwhile it seemed the problem disappeared by changing the desktop-background. but... there it is again. here are the screenshots. as you can see in the options rainlendar-window-position should be fix..

[http://www.rainlendar.net/cms/images/fbfiles/images/rainl\\_options.jpg](http://www.rainlendar.net/cms/images/fbfiles/images/rainl_options.jpg)

"save window position" in the advanced options is also enabled

First, "Fensterpositionen fixieren" (Lock windows in place) mean you cannot move windows, it is no absolute relationship with your question.

---

Not sure whether are relate, looks the images you posted the font of desktop-icons is different, why? login-username is same?

If login-username is different, usually will got different result.

yes, login-username is the same.

:( ?

The width of the events window is different in the screenshots (even if you ignore the scaling) which would suggest that different settings are used. If you start Rainlendar in the debug mode the debug log will contain the path where Rainlendar reads its settings. Do that with both versions and check what the "Config" path is in the logs.

the debug.exe always started the rainlendar window at the same position, although the normal mode still came randomly. i tried several times, several days.

so there were no different logs to compare, but at least the ini-file the debug used was in the correct user-directory.

i scanned the whole system for rainlendar2.ini and there was only 1 for the current user, but of course a second one in the second users directory.

so i decided to reinstall and make a new installation, this time only for 1 user to get rid of the problem.

maybe the whole thing occured because under my account there is access permitted to the other user-directory.

thanks for support

Are the two users running Rainlendar simultaneously(one user session 'minimized' and the other active) when this happens?

no, definetly not. it occured right with the systemstart. during the session, the rainlendar-window stayed at the place where it started.

aargh, it happend again, despite new installation.

i added the debug-logfile. maybe Rainy or Jorge\_Luis might take a look, please.

kind regards  
frank

I couldn't find anything suspicious in the logfile.

The values of the Event List (Termine) are (165,300,583,429) (width,height,pos x,pos y) and the height changes to 63 because the number of events listed.

am i the only one with this kind of behaviour?

seems to me as it depends from the moment within the systemstart-process.  
manual start always comes in the position it is supposed to.

You are the only one who has reported this issue so it at least is not very common. There probably is something in your system which causes the behavior.

hi there,

i found out myself:

- 1.it depends from the exakt moment of starting rainlender within the whole startup process
- 2.i have my font-size in the system on 150%

so whether rainlender starts first or the 150%-option i get a different appearance on the desktop

kind regards
