## print high and landscape

Posted by nickname - 2012/07/13 05:45

---

A new question for my work with...

I want to print every week the next "one" week.

I try to print it high, I try to print only one day, it doesn't work...

I had to choose only one day, then I become 1 week. Did I choose 1 week I become 2 weeks.

It doesn't matter if I choose high or landscape, only landscape is the result :(

That's a little bit crazy... My wish is to print one week in high not Landscape, what shall I do???

greetings

Currently only landscape is supported when printing the events in calendar. And it will also always show full weeks even if you select the start and end dates from the middle of the week. The printing support in Rainlendar is rather limited so that's one thing I'm planning to improve in the coming releases. My current plan is to drop the direct printing support from Rainlendar and just generate a web page of the calendar and let the browser worry about the printing.

After I read the Rainy message, I started to create a skin which generates a HTML file with the same aspect (as possible) of the Print preview.

At this moment, I only could make (more-or-less) the "Day Range".

Before anything, a file path needs to be set as option for the skin.

I know there are some issues:

- The skin isn't foolproof (I'm not validating the dates, but this isn't very hard to do).
- One disadvantage of HTML vs. PDF, is that you need to enable background print to get the same visual aspect.
- The summary isn't complete. (I need at least to add start and end time)

Beyond this skin, I found a workaround to print 1 week instead of 2. Well... isn't so good, but it works. Only changing the start weekday. (e.g. Friday 20 to Tuesday 24 are 2 weeks starting on Monday, but only 1 starting on Friday)
