## Changing text direction based on language

Posted by akrabi - 2012/07/18 23:33

---

Hi there.

I'm trying to edit an RSS reader taken from Chromosphere so that it detects the feed's language and changes the RSS window text direction accordingly.

What I want is that if I detect let's say Hebrew it will change the text direction to RTL.

I've succeeded in detecting the language searching for the language tag:

```
-- Get language of Feed
_, _, feed_lang = data.find("(.-)")
```

It works.

Now I would like to do something like:

```
if (feed_lang == "he") then
  -- Change the text direction in the Chromosphere RSS window...
end
```

The question is how can I make that change?

Thanks for any help... :)
