
Skin to \"print\" calendars to HTML files

Posted by Jorge_Luis - 2012/07/22 22:22

After I read a Rainy's message, I started to create a skin which generate a HTML file with the same aspect (as possible) of the Print preview. (original post).

Any suggestion/idea/layout will be welcome (if it's possible to make :unsure:).

This is just a workaround until Rainy implements a new Printer dialog ;)

My apologies for any bug... creating this in lua isn't the best thing... wxWidgets is so much easy... :P

How to use:

- FIRST!!! Change the target file in the option of the skin.
- Select the kind of print
- Change the options (not all works for all kinds of print)
- Check/Uncheck the calendars you want to include
- Change start/end date
- Click on printer icon
- Open your target file
- Done!

This skin supports this planner layout

Known issues:

- Some visual options are lost when another option changes (start/end dates specially)
- One disadvantage of HTML vs. PDF is that you need to enable background colors and images when printing to get the same visual aspect as the screen.
- Items without calendar assigned are not listed
- I can't (don't know how) check Daylight Saving Time
- The long date format is fixed: "weekday, day monthname year" (I don't know how to retrieve the system long date format)
- By selection list isn't possible (unless if the selected items are copied to a new calendar and select only this calendar)

Additional notes:

About the "Items without calendar", I think this only could be solved if in Rainlendar_ListAllComponents(,) I could use: a calendar name, nil for all and "" for

Re:Skin to \"print\" calendars to HTML files

Version updated to 0.3

- All options are moved from window to skin's options dialog.
 - Option to show/hide weekend days. <http://www.rainlendar.net/cms/images/fbfiles/files/Printer-9b48acd7174fdb01cbbc2f0ff362ea5.zip>
-
