## Skin does not remember its position

Posted by PeterPanino - 2012/07/23 15:54

---

Hi, I have made a new skin and it works well. However, when I refresh Rainlendar this skin always jumps to the center of the screen, while the other skins always stay in place. So why this skin does not remember its position?

Problem solved: The window ID was named to "weekday" which obviously confused Rainlendar:

Did you add the line `AddSkinRectangles=1` in the `DefaultSettings` section of `Rainlendar.ini`?  
This will help you to see the real size of the window. Maybe the height or width is too big.

Search for the `WindowPositionX` and `WindowPositionY` and check if they change when you move the skin and refresh.
