## Rainlendar 2.11 BETA build 121

Posted by Rainy - 2012/07/29 10:58

---

Build 121 can be downloaded from here:

Windows (32-bit): Rainlendar-2.11.b121-32bit.zip  
Windows (64-bit): Rainlendar-2.11.b121-64bit.zip  
Linux TAR (32-bit): Rainlendar-2.11.b121-i386.tar.bz2  
Linux DEB (32-bit): rainlendar2-pro\_2.11.b121-1\_i386.deb  
Linux TAR (64-bit): Rainlendar-2.11.b121-amd64.tar.bz2  
Linux DEB (64-bit): rainlendar2-pro\_2.11.b121-1\_amd64.deb  
Mac OS X (Intel): Rainlendar-2.11.b121.dmg

MD5SUMS-b121

The widget addon: Shadow4-Widgets.r2skin-addon

This is beta version! It has not been tested.

Note: The wxWidgets update caused all kinds of issues so this probably isn't very stable build. Use with caution.

Changes:

- o Added support for CalDAV.
- o Updated the icons in the options dialog.
- o Changed the numeric edit controls to spin controls in the event and task editors.
- o Added large version of the calendar window to the Shadow4 skin.
- o New Google tasks were not updated correctly to the offline copy which created duplicates.
- o Changing the value of "Show tray status icons" could not be done.
- o Skin settings were not saved correctly if there were multiple instances of the same window active.
- o Skin details show also the version history for the skin.
- o Added event handlers for enabling/disabling calendars and refresh & quit Rainlendar.
- o Updated to wxWidgets 2.9.4.

After updating to this build (Windows 7, 64 bit) I get an error message: MSVP100.DLL is missing. Huh?

---

---

---

I added the missing dll to the zip files. Try downloading it again.

Some issues I found:

- \* The lists from categories dialog and settings dialog are outside the frame.
- \* The translation of "Hotkey" can be bigger than the tab width.
- \* All added categories are stored with normal font colors. I remember having troubles with the categories when I made it. So, I had to accept that they can't be stored in the same place as the normal.

PS: Thanks for the "(original version by ...)" :cheer:

If path has double-bytes characters (eg. Chinese-word) will got a error message:  
[http://www.rainlendar.net/cms/images/fbfiles/images/2012\\_07\\_30\\_6.png](http://www.rainlendar.net/cms/images/fbfiles/images/2012_07_30_6.png)

20120801 Added:

If use Rainlendar\_Message(string, 0) also will got a error message.

\* The lists from categories dialog and settings dialog are outside the frame.  
Problem found and fixed.

\* The translation of "Hotkey" can be bigger than the tab width.

I'll change this so that the text will get wrapped if it contains a space or otherwise it will be cut (with "...").

\* All added categories are stored with normal font colors. I remember having troubles with the categories when I made it. So, I had to accept that they can't be stored in the same place as the normal. I forgot all about the custom categories. I think I have to add a functionality to the category templates so that you can target them to a specific skin window.

If path has double-bytes characters (eg. Chinese-word) will got error message:

You actually shouldn't see those assert error dialogs. I probably didn't compile the wxWidgets library with correct flags. Anyway, I think I found what caused the problem with the foreign characters in the path. I'll fix it in the next build.

segfaults on Linux (Arch Linux 64-bit) here. No useful error message, sorry (it just dumps core). Would gdb be of any help? beta 119 was fine.

  - o Skin details show also the version history for the skin.
  - o Added event handlers for enabling/disabling calendars and refresh & quit Rainlendar.
  - o Updated to wxWidgets 2.9.4.
- I had the language set to Default set, and in this version Default is some kind of a mix between English and Dutch I assume (or some other similar language). It's different in every window: some had English only, some had only Dutch (or whatever else it was), some had both. Setting is to English fixed it.

Is that supposed to be like this? (don't think so)

@ngoonee: Please include the backtrace from gdb.

@bugreporter: I think the language codes have changed in the new wxWidgets which causes a random language to be chosen at startup. I'll probably need to change name of the setting so that after upgrading it reverts to the default language instead.

Google Tasks lists that are empty list the to-do item as 'null', rather than just omitting the list like in previous versions.

Google Tasks lists that are empty list the to-do item as 'null', rather than just omitting the list like in previous versions. Will be fixed in the next build.

How can I add custom icons for the large calendar?  
You'll have to wait for the next build.

This happens to me today when I was trying to add a skin using the file association (Win 7 32bits) and Rainlendar2 running. If Rainlendar2 is closed and use the file association or if I drag&drop on a window then it works right.

<http://www.rainlendar.net/cms/images/fbfiles/images/error.png>

I have another picture of a more stupid error. I was making a script to download the date of an event from a website. It works fine, but 4 call stack dialogs appears. The error was trying to create a time upside-down: `os.time{year=10, month=8, day=2012}`  
Of course, wxWidgets yell out starting with `IsValid()` and "JDN out of range".  
It worth the mention.

@anoob: I found (and fixed) one issue which probably caused the settings to reset on restore. It will hopefully work better in the next build.

@Jorge\_Luis: The API had changed in the new wxWidgets so now the old code asserts. I'll fix that. The assertions for the invalid dates should not appear in the release build so they can be ignored for now.
