
successive month display - not workin

Posted by petiot - 2012/07/31 05:45

Hi all,

I am struggling to display two calendar windows showing current and next month

I did: right click/options/skins/added two calendar windows/settings, set the "visible month" to 0 and +1 respectively

What happens is that both calendar show the month which value I entered last. Also, if i force the month to let's say 5, it still show current month.

I am using pro 2.1 (trial version), the Steam skin (but the problem is the same with any other skin I have tried.

Any help really appreciated

Regards, Dan

This was an error which start in previous beta and made it way to the stable release. Unfortunately, you need to download the beta release to fix this problem.

Rainy wrote:

This is beta version! It has not been tested.

Note: The wxWidgets update caused all kinds of issues so this probably isn't very stable build. Use with caution.

Changes:

- o Skin settings were not saved correctly if there were multiple instances of the same window active.

Post: Rainlendar 2.11 BETA build 121

But if you don't want to use a beta build, there is another way editing the config file, using this steps:

http://www.rainlendar.net/cms/index.php?option=com_kunena&Itemid=42&func=view&catid=4&id=17497#17503

In your case, you need to find (e.g.):

Visible_month=+1
