## Only one-way communication with Google calendar

Posted by kenoodle - 2012/08/06 09:48

---

Events posted to local Rainlendar upload to Google calendar. Events posted to Google calendar download to iCal but not to Rainlendar.

Version 2.10 (b120) 32 bit Build on Jul 2 2012

Mac OS 10.7.4

Not even if you refresh Rainlendar? Are you sure the events are in the correct calendar?

Yep! Tried everything I could think of. Probably right in front of me, as you will point out.

Try this:

- Disable all your current calendars in Rainlendar
- Create a new calendar to your Google calendar (in the Google's website)
- Create a new Google calendar in Rainlendar and choose the newly created calendar
- Add an event to your Google calendar (in the Google's website) and make sure it was added to the correct calendar
- Refresh Rainlendar, wait a while and check from the manager dialog if the new event is shown in there.

If you still don't see the event start Rainlendar in the debug mode and send the debug log. I can check from it what exactly the server is sending to Rainlendar.

Hello,

I'm actually having the opposite problem. Events entered in Google Calendar are showing up on the Rainlendar calendar, but nothing inputted on the Rainlendar calendar is being updated on my Google Calendar. Is there some setting that needs to be changed that i'm missing? Thank you!

---

You have to select the Google calendar as target (the selection is in the bottom left corner of the dialog) when you create a new event.

I discovered that events entered at Google calendar show up in Manager, and Rainlendar alarms function correctly, but they do not show in the Event List nor Grid Calendar. (Tried to attach Log, but it was refused because it was too large.)

You should check that you don't define any include or exclude calendars in the windows' settings.

Tried everything and finally swapped the current Chromophore Event List skin for Shadow4, and it worked! I shut down and rebooted, then swapped the skins back the other way, and now Chromophore works!

:blink: ??
