
Rainlendar 2.10 is not working on Mageia Linux

Posted by brandy - 2012/08/31 05:39

Hi!

I switched to Mageia and want to use my favourite calendar. Unfortunately i wasn't able to install it. I open a thread in the Mageia-forum, as I thought it is a problem with the system - here the link:
<https://forums.mageia.org/de/viewtopic.php?f=7&t=885&p=10600#p10600>

The person there, who was posting an answer, said, that he was able to install 2.8 - I wasn't able to. I only get a solution by loading the .exe and install it on wine.
Maybe you have a better solution!

Thank you very much!

Usually if you cannot start the application it means that you are missing some libraries that are needed. Start Rainlendar from the terminal and see what errors do you get. The 2.10 needs quite new libc which probably isn't updated to all distros yet so the 2.9 might work better.

Ok I downloaded 2.8 and want to start it with clicking on rainlendar2 and by opening it trough the terminal. Unfortunately both don't work.
Thank you for your help.

You didn't get any errors in the output when you tried to start Rainlendar from the terminal?

Do I have to copy the rainlendar-folder to a special folder. I extract it in Downloads - when I go to Downloads/rainlendar2 and open rainlendar2 nothing happens except "Kommando nicht gefunden".
Thank you very much!

Your download folder is probably not in the path so you need to first change into the folder where you extracted Rainlendar and start the program like this:

```
./rainlendar2
```

I downloaded rainlendar and so the files were in the Download-folder. Then in the terminal I was changing the directory with `cd .` With `ls` I checked, if I was in the right directory. When I was in the rainlendar2-folder I entered `rainlendar2` in the terminal but nothing happened.

By "nothing happened" do you mean that you got the error that the command doesn't exist? If so, you need to add the `./` in front of the `"rainlendar2"` when you try to run it.

Posted by brandy - 2012/09/04 11:34

I added `./` to `rainlendar2` and I got this message:

```
./rainlendar2: error while loading shared libraries: libpng12.so.0: cannot open shared object file: No such file or directory
```

=====

Re:Rainlendar 2.10 is not working on Mageia Linux

Posted by Rainy - 2012/09/04 12:30

The error means that you don't have `libpng` installed or the one you have is too old. So, install the library and try again. Repeat this as long as you don't get anymore errors about missing shared libraries.

=====

Ok, with the right libraries 2.8 is working on Mageia...
Thank you ver much!
