## Help not displaying correctly

Posted by bits - 2012/09/08 08:44

---

Using registered version Rainlendar PRO 2.10 (b120) 64bit  
OS is Win7 64bit

When I click on help in program, it does not display as a html file.

Coding shows, but that makes it very difficult to read;  
ie, tags etc instructions show but as a text file not as a web document.

Is this a bug, or can it be corrected somehow by me?

The help might have corrupted. Try to reinstall the application and see if that helps. You can also just extract the html files from the help archive (just rename the Rainlendar2.htb to Rainlendar2.zip) and open them with a browser.

Thanks for response Rainy.

Tried reinstalling, including re-download, did not solve problem.

Suggestion on unzipping works, but appears an awkward solution outside of the user manual. But it does work.

At this point, I was specifically looking to the skin and API manuals. I had wanted to do some moding of skins before constructing from scratch.
