## WetChromo Weather not working properly [solved]

Posted by ichinoeda - 2012/09/18 03:38

---

Hi.

I don't know if this is more a skin problem, but WetChromo cannot display weather information properly.

That means for every day there's always the same symbol (sun with cloud) and no description (both weekday-name and weather description like sunny e.g. missing). No error message. Hometown is displayed rightly.

[http://www.rainlendar.net/cms/images/fbfiles/images/rainy\\_weather.png](http://www.rainlendar.net/cms/images/fbfiles/images/rainy_weather.png)

I only realized it when I tried the last beta build 2.11 b123. But it's actually the same with rainlendar stable 2.10 b120. Still works with 2.10 b117.

I'm an Arch user (I know - pain in the ... for every developer:P

I'd really like to have my weather back. And I'd like to use the new version as well as I think using the authorization method from the os is a pretty good idea!

Thanks for your good work Rainy! Appreciate it!

Edit:

Sorry wanted to add it to the latest beta build thread (version 2.11 b123).
