## Android app and widget

Posted by aso777 - 2012/09/18 13:56

---

Would be amazing to have an android widget for rainlendar, it will bring so much more revenue.

Also I am a java coder I can help out for creating that app

This would be the killer Android calendar app, there is no other app that looks as cool as rainlendar for Android. Its almost linux right? :)

Yes. Could you make a Rainlendar android app. One thing I hate about stock calendar apps is that you can't colour code/select the categories for the reminders. What happens is that I go back to the desktop calendar and reassign categories there

I like to throw my support behind this as well.

I am currently using ICSync on my Android phone but unfortunately it screws up my ICS file everytime it uploads a change to my server. This of course requires me to log in to my server and remove the corrupted calendar. Rainlendar has never had this problem since I bought it a year or so ago.

I am also willing to pay another 10 euros for an Android version because Rainlendar is the ONLY calendar will connect to

---

my ftp server and offers a working version for all my operating systems (Windows and Linux).

I'm currently using a combination of a bat file to copy my Rainlendar ICS file to dropbox. I then use Dropsync on my Android tablet to move the file to a local folder. I then use ICSsync or Calendarsync whichever one I can get to get to work to parse the file and import it into the calendar. It works but is prone to failure and various glitches. I would, like everyone else, love it if you could develop an app for Android.

Robert
