
Recurring event in Outlook calendar

Posted by AndiDi - 2012/09/21 01:57

I have a recurring event in my Outlook calendar that is displayed by rainlendar. This event happens every week.

This event was created in another time zone that does not have daylight saving. It was created in February (no daylight saving for my timezone too).

If the event is displayed in August (1 hour daylight saving) the time of the event is one hour off (amount of daylight saving).

It is the other way round when the event is created in August and displayed in February.

The event is displayed fine in Outlook.

I had this problem right from the beginning I started using Rainlendar Pro.

Unfortunately Rainlendar does not support different time zones so all the time is always converted from the UTC to the local time or kept as it is if it's not defined in UTC. The same limitation applies also to the daylight saving time adjustment.
