## Cannot edit ToodleDo Tasks

Posted by virus - 2012/09/29 20:46

---

Hi, following my previous bug report, I decided to try toodledo instead of remember the milk since it is not able to edit descriptions anymore, at least for this build.

However, I realised that any tasks I tried to edit on my toodledo will have an error whenever I pressed the enter key. This is real serious so I hope it is fixed real soon.

Thank you.

Hmm... I'm not able to reproduce this. Can you describe what exactly I have to do to get the error message? Can you also tell what the error message contains?

Hi, I went to edit an existing task I have created on my toodledo. Type a long message with many enter (line breaks) and click save. The error will occur.

Currently Toodledo is read-only, which means you can read the entries in Rainlendar but not edit them via Rainlendar. I am also hoping that Toodledo will be soon fully integrated into Rainlendar!

How long is "long message"? I edited a task in Rainlendar and added ~30 lines of text to the description field and everything worked fine. If I paste a 1000 lines of text the server returns an error that the content is too long (for which Rainlendar didn't actually show any error which is a bug).

Hi, I just typed the following message.

Hi,  
how  
are  
you.

And it already caused an error.. I was editing an existing note I created via the ToodleDo website at that time though.

I still cannot reproduce this. Can you run Rainlendar in the debug mode and edit the event so that it creates the error? Then send the debug log to the Rainlendar's support address with a link to this forum thread.
