
How to add an event??

Posted by NiceGuy12 - 2007/01/15 22:56

Hello all,

Downloaded Rainlendar and installed it on my Fedora Core 6 Machine today (done upon the advice of a co-worker) ... one question .. how do you add a recurring event. It would appear to be a simple issue. Here, it would probably be much better if I explain the steps I am taking:

1. Right click on the desktop rainlendar calendar. (Actually I right click on the last day of this month, January 2007, since the last day of the month is the recurring day for my event that I would like to add)
2. The menu then appears afterward, I follow the "Add Event Link"
3. I fill out some information pertaining to the event on both the event-tab and recurrence-tab.
4. Once I believe I am finished entering in informaion. the okay button, the one you would normally click to submit that your done, never turns on. What I mean is, I can never press the "ok" because it appears to always be disabled.

Can some help??

Thanks and Take Care

Double check to make sure you have a calendar selected. On the main information page at the bottom there is a button that says calendar with a text box next to it. If the text box is empty you need to pick a calendar.

I'm having the same problem, and it's not a calendar selection issue. When I go to add an event in rainlendar there is no calendar to choose from. I use Outlook's calendar, and set that as the only one, however it doesn't show when you click on the calendar tab when you're trying to add an event.

Any suggestions?

indyjoe: I don't think the problem is the same since Outlook doesn't work in Linux. Anyway the list only shows calendars which support writing. Outlook calendars do not do that at the moment.

Hello again,

After taking a couple days off, I have now return .. the problem I have ben having is that I have no calendars. Maybe something is missing in my theory??

I guess if that's the case, where di I get calendars from?? I am on a Linux machine, and so I do not use Outlook.

Any suggestions??
Thanks again and Take Care

Go, into options and click on calendars. Usually there is a default calendar here. Either way try adding a new ical calendar and see what you get.

Hello again,

I right click on the calendar ... select Options, then click on the Options Tab ... this screen has two empty areas separated by a "Add" button:

Two Areas:
1. Calendars
2. Settings

When I click on the "Add" button, a new prompt appears asking me to select a calendar .. but I have none. I'm a little hazy on If I am required to download some, or if I am jus missin something here.

If I do have to get some, where should I place them (AND any reccommendation on where to get them).. the "Add" prompt does not have a "browse" capability si I am unable to braose my filesyatem to locate any??

Thanks again

Sounds odd, it doesn't sound familiar. Here are some screen shot as to what it should look like.

Hello,

Yeah yours is different then mine ... I have no "icalendars" .. maybe I need to install them ... could that be it??

I mean ... does'nt rainlendar come with calendars?? Shouldn't it have a at least a default set??

Thanks again

I'm having the same problem, there's no "Default.ics" file.
I was thinking of copying it from my Win XP box, but I don't know where to place it in FC6?

Have you checked the Rainlendar's log for possible error messages? Could the reason be the same as this:

http://www.rainlendar.net/cms/index.php?option=com_joomlaboard&Itemid=27&func=view&id=1926&catid=3#1926

That was it, I disable SELinux and did a re-install and it works.:cheer:

I still got an error message in the log file "Error: can't open file '/home/JimB/.config/.rainlendar2/license.r2lic' (error 2: No such file or directory)" but it seems to be working fine.

EDIT: I installed the lite version.

There should always be an "icalendars" option when you click the add button. You don't need to install icals, just tell it where you want it using the wizard.

Hello again,

I can see this being a issue ... (that is disabling SELinux). I will try to look into it further .. unless somebody already knows how to add Rainlendar to an SELinux exception list .. well then that would be terrific.

Thanks again

Hello,

Here is my Solution:

To allow rainlendar and have SELinux enabled:

1. Goto: Administration -> Security Level and Firewall
2. Select: "SELinux" Tab
3. Expand SELinux Policy
4. Expand Memory Protection
5. Check "Allow all unconfined executables to use libraries ..."
6. Done!!

You may or may not have to reboot .. to be honest I forgot .. but I did reboot, just not sure if it is required.

Adding a calendar is pretty straight forward after that as the default calendar now show up.

Take Care and Good Luck
