
Subtasks with Google Tasks not working

Posted by eyebex - 2012/10/26 02:54

Hi,

I'm using Rainlendar 2.11 build 125 beta on Win 7 x64 with Google Tasks. While standard tasks work ok, creating subtasks does not. After refreshing they are just created on the same level as their parent task, and Rainlendar complains about not finding the subtask.

It seems that with Google Tasks subtasks are not a separate type of task, but just regular tasks that are indented: Create "subtasks" by using Tab to indent them, and Shift + Tab to move them back. Can this be the problem?

Is there some specific way I need to create/modify the tasks to be able to reproduce this? I tried by creating a task in Google's website and added couple of subtasks for it and after refreshing Rainlendar the tasks were shown as subtasks like they should.

I tried to do it the other way around: I created the subtasks in Rainlendar, and looked at them in Google.
