
Can't write to Network Shared File Win 7 64 Bit Pr

Posted by jack3585 - 2012/11/08 10:01

I have installed Rainlendar Pro on two network computers running Windows 7 64 bit.
I have a shared Folder containing the calendar files on one of the machines. When I try to write to the shared file from the other machine, the program stops responding. The files can be read from both machines but can only be written from the machine where the file is stored. Is this a bug or am I missing something here? When I had all XP machines, every worked great.
Help

Welcome to the forum, jack3585.
It sounded seem is problem of operating system instead of Rainlendar.
You can search internet with keywords "win7 + share + write" to find how to set.
Here is one:

Permissions are set to "Everyon-Full control. I can write (copy and pase) to the folder but can't write thru Rainlendar. I have shared the calendar Folder.

I tried this by sharing a folders between Win8 and Win7 (both 64bit) and storing the calendar file to the different computer and everything worked fine (both ways). So, the problem probably is in your configuration but unfortunately I cannot say what exactly could be causing it.

What configuration? Rainlendar or Win 7?
