## toodledo subtask not working

Posted by Metzlmane - 2012/11/08 10:09

---

Hy,

i'm trying to figure out how to create subtasks in rainlendar or toodledo and synchronize them.

If i create a subtask in rainlendar, it's successfully created in toodledo but on a refresh it's shown as a normal task in rainlendar, not as a subtask.

Do i have to change specific settings?

I have the same problem.

Actually I paid for Toodledo and for the Rainlendar because of this feature.

Anybody knows, is there any solution?

Do the subtasks work if you create them in Toodledo? Can you run Rainlendar in the debug mode and send the debug log to me (use the support email address and include a link to this forum thread). If you have multiple calendars enabled please disable all the others so that the log will contain only the calendar which has the problem. When you are running in debug mode just create the subtask in Rainlendar and do a refresh so that the problem is shown.
