
Installing in Linux

Posted by Rebecca_D - 2012/11/08 19:43

Hi. I am a great fan of Rainlendar having used it on a Win7 machine, but Win7 went belly up so I have now installed PClinuxOS (KDE). I am completely new to Linux and would like some simple instructions (:unsure:) as to how to get the Rainlendar .exe file installed. As RL is platform independent I thought you might have a download specifically for Linux users, but hey ho it's a steep learning curve I'm on!

if you don't know that you can't run an *.exe file on Linux... please start learning first. There are downloads for Linux on this site. Just click: [Show all downloads](#).

There are millions of how-to's on google. Just use it ;)

Linux dont use .exe-files at all, so you must download Rainlendar-file for Linux-distribution.

http://www.rainlendar.net/cms/index.php?option=com_rny_download&Itemid=32

Debian/Ubuntu-version works also in Mint.

Use Gdebi-installer. If you dont have Gdebi, you can install it in terminal; `sudo apt-get install gdebi`

Right click on file, and gdebi install Rainlendar.

Make automatic startup on desktop for Rainlendar in startup menu of your distribution:

File system > usr > bin > Rainlendar2.

This works for Ubuntu, Xubuntu and Mint. In Xubuntu I have small error:

http://www.rainlendar.net/cms/index.php?option=com_kunena&Itemid=42&func=view&catid=3&id=18342#18342

Others dont know.
