
Black border around skins after xfce session

Posted by Paco62 - 2012/11/16 17:04

Using Xubuntu 12.04. Normally I log in with xubuntu session, but for once tried logging in with xfce sessions. This damaged rainlendar, causing the windows to get on on the top of the other, and an ugly black border around all skins and tooltips. After much purging and reinstalling, I finally managed to get the windows back to normal, but the black border remains. How to get rid of it?

A screenshot would have been helpful but my guess is that the xfce desktop does not support transparency so Rainlendar will revert to the window regions which creates black borders especially in the Shadow4 skin.

Same here in Xubuntu 12.04, but not in Ubuntu and Mint.

I think it is bug in Xfce4, because similar transparency problem is in Screenlets > Slideshow, where black border jumps to different places, and bottom launcher is only black, and I can not change it.

Black border in Rainlendar:

But it is not a problem on dark wallpaper:
