
wxwidgets debug alert

Posted by sholmes1 - 2012/12/28 10:44

I just installed Rainlendar Pro 2.11 (b128) after getting the update notice. Every time Rainlendar loads I get a wxwidgets debug alert. I can click "Cancel" and the alerts stop for this load, but return the next time. If I click "No" then I get alert after alert. Looking at the path for some of the alerts they don't exist on my computer.

I attached a pic with a few of the alerts. http://www.rainlendar.net/cms/images/fbfiles/images/Debug_Alert.jpg

The asserts about wxDateTime usually mean that the dates in some of the events are invalid (e.g. missing or end date before start date). The assert in the wxPropertyGrid is probably caused by an incorrect translation text.

Anyway, in most cases they are not critical so I disabled them from the release version. Just download Rainlendar again and reinstall and you should not see them anymore.

I installed the 32b version and the problem is gone now.

Thank you...
