
Google Calender: target calendar not defined

Posted by senior_spielbergo - 2013/01/03 15:18

Hello,

at the moment I am facing a problem while setting up rainlendar with Google Calendar. When creating the new calendar in rainlendar I can choose which of the calendars on Google I want to use. But when I try add a new event I get following error message:

Google Error!

The event cannot be uploaded because the target calendar hasn't been defined.

I already googled and tried a few things but I have not solved this problem.

Does anybody know how to solve this issue? Any hints are appreciated :)

Thanks in advance

David

Does anybody have ideas on this? Might this be a bug with 2.11 beta 127?

Have you tried 2.11, build 128? (I think b stands for build and not beta)

The error is shown if Rainlendar cannot find the given calendar from Google. Try recreating the calendar in Rainlendar and see if that helps (make sure you don't get any errors while creating the calendar). Removing any special characters from the calendar name might also help.

Hello Rainy,

thanks for the answers. I tried to recreate the calendar and there were no errors while adding it. But the next time I tried to add an event there was the same error as described below. I also checked on special characters but there are none used.

Can you run Rainlendar in the debug mode and send the debug log to me (you can use the Rainlendar's support address)? I can try to check from it why the calendar cannot be found.

Thanks for your answer! I solved the problem using the debug mode. I did not know that it existed.

When looking at the log I realized that I have got a bad authentication (error 403). Reason is that when adding the calendar to rainlendar, somehow a wrong password was stored. I realized this when looking closely at the settings and I saw that there were about 20 stars (*) in the password field. My password is only 9 characters long. So I replaced the 20 stars with my password and it worked.

I am not sure if this is a bug or something. If you are interested in the log file anyways, I can send it to you.

Thanks again. :)
