Rainlendar2 2.11 (b128) 32 bit Windows 7 SP1 64-bit

Export now exports zero events, regardless of how many events are in the calendar.

It looks that only the selected events are exported. I'll change it like it was before so that if there is no selection everything is exported.

Thanks! The problem was on a relative's PC. I tried selecting an event then holding Shift and pressing the down arrow to select multiple events, but that didn't work. I should have tried selecting the top event, then holding Shift and selecting the bottom one. That would have worked. So I apologise for not trying more options at the time.
