
Sync rainlendar with iCloud Server:

Posted by znhbj - 2013/01/05 22:05

Option->calendar->add->caldav calendar

URL = CalDav server name

User name = your AppleID email address

Password = your AppleID password

note:

CalDav server of icloud:

<https://p02-caldav.icloud.com>

<https://p04-caldav.icloud.com>

<https://p06-caldav.icloud.com>

Is it possible to write an announcement with rainlendar to the iCloud-calendar with this method?

Re:Sync rainlendar with iCloud Server:

Yes.

Re:Sync rainlendar with iCloud Server:

I'm only getting an error: "Server respond: (0) 403 Forbidden."

But Rainlendar has no problem getting my appointments from iCloud. Also new appointments I'm creating on my iPhone are getting synced.

But creating an appointment via Rainlendar causes the error.

When creating events to iCloud make sure that you define different start and end times since iCloud doesn't seem to support events without end date. If that doesn't help run Rainlendar in the debug mode and send the debug log to me (use the support email address and include a link to this forum thread). If you have multiple calendars enabled please disable all the others so that the log will contain only the calendar which has the problem.

The hint with different start and end time worked :)

Now the last problem is, that appointments from Rainlendar have the wrong time zone.

How do I fix that?

Edit: I've made a how to with pictures :)

Thanks for the How To. It's very useful now with the images.

The time zones are problematic since Rainlendar does not support them. At the moment all events that are created with Rainlendar are set to UTC time zone. I have a pending task in my backlog to add support for time zones but retrofitting them now is not trivial since they affect all date calculations.

Since a few days, syncing with iCloud via calDAV doesn't work any more.

I get a connection error with the hint to check my username and password, but I didn't change anything.

Checked username and password anyway, anything is correct.

After that I deleted the calendar and tried to set it up again. Now I get a connection error, when I want to choose the calendar. :huh:

Edit: With the latest Beta everything is OK again :)
