
Hiding events from the main calendar?

Posted by Kea - 2013/01/10 07:23

Hi;

In my old calendar software, I was able to create a calendar that display alarm popups, but did not show the events on the monthly calendar window (usefull for keeping the calendar's appearance clean while using several daily reminders). How can I do this with Rainlendar?

If you have all these events in a separate file you can exclude this file in each calendar window. the events will be still loaded but not visible.
To exclude: right click on a window, options, skins, active windows, settings..., exclude calendar (or it could be category)

The "" category can also be used to hide the events from the calendar but still show them in the alarm.
