## New skin: \"Words\" clock\". Help with languages.

Posted by Jorge\_Luis - 2013/01/21 16:33

---

I made an emulation of the QLOCKTWO Clock from Biegert & Funk.

The languages it has are:

English,  
Spanish,  
German (and an alternative),  
Norwegian,  
Dutch,  
Italian,  
French,  
and Swedish.

I have the drafts for Danish, Turkish and Russian and a picture for Arabic.  
If anyone has knowledge of these languages and could help me, I would appreciate it.

Here's the skin: <http://fav.me/d5s9jn0>  
and here's a picture for 7:26 PM (or 7:25 + 1)

There is a bug on my PC.  
You can see, it can not display the "W" character.  
It happen on :

English  
Dutch  
Nederlands  
Svenska

<http://cdn0.qooooo.com/img/3/23978-2.png>

Add: just appear occasionally.

It might be a problem with the size of the elements. I see to reduce the size of the font or to increase the distance between characters (although I prefer the first one).

EDIT: I duplicate the size for the characters and upload the skin into deviantART. Now you should see the W.

What I don't understand is why the characters are so close together. I can see the dots of Ä are in the previous line... I suppose the font is the same... so...

Ooh! Sorry, I found it is my wrong.  
The reason is, because previously I set "font scale" as 150 to test some skins, and forgot to set it back to normal.  
Sorry again about causing you distress.

Not sure if possible, but what I need is to copy these words ([itsasmallweb.files.wordpress.com/2011/02/qlocktwo5.png](http://itsasmallweb.files.wordpress.com/2011/02/qlocktwo5.png))  
from left to right, up to down, one by one in a utf-8 text file.  
My problem is I don't know arabic writing or recognize each individual character.

Thanks in advance, nem0.
