
network problem

Posted by Schreck - 2007/01/19 07:43

hey guys,

i want to upload my data to my ftp server. but rainlendar says "error 550 requested action not taken".
the strange thing is can easily download my data -.-

The error comes from your ftp server. Have you checked what the server's logs contain?

He connects to the server, then the server enters passive mode, after that nothing more happens.

So the server doesn't give any reason why it returns an error? Have you tried some other ftp server software which might work better or at least output some proper logs?

Filezilla is running on in. Can you give me an alternative ftp-server?
