
Poll for changes resets

Posted by Dmitrij - 2013/03/10 10:47

Have Toodledo calendar. Win7/user account.

If I have Poll for changes marked together with Keep offline copy then Poll for changes getting reset (became unmarked) after saving options.

Could you fix this, please.

Also, how often the calendar reading data from Toodledo ?

Thanks.

This is fixed now :-)

The poll frequency for Toodledo is one hour which I think was the minimum they allow for 3rd party apps.

I've tried the new version to fix this problem, and have had 2 crashes (under XP) in the last 24 hours. I have a pretty simple configuration, just the default calendar and a sparse toodledo task list.

I will now try running it all day with poll for changes on the toodledo calendar disabled.

It has not crashed today, the only setting that has changed has been the disabling of toodle-polling

Can you create a dump file for the crash?

Sure, will do. I'll look at this over the weekend. Have switched to RTM now which I find I quite like and will probably stay with instead of toodledo, but am keen to help as so much work has gone into your app so will reproduce it with a dump file shortly.
