## Google Authenticator

---

Hi, a long time user of Rainlendar and thanks for a great product.

However with current email systems being hacked daily (Yahoo and Hotmail) I have decided to use Google Authenticator which employs a two step verification process to validate GMail accounts.

This now manifests itself in giving me an error warning in Rainlendar because it needs a new password (Google generated) before it will link my GMail calendar with Rainlendar.

I have tried this a couple of times but have failed, miserably!

Any input from Rainlendar users as to how this should be done (correctly) would be appreciated.

Many thanks.

You have to create an application specific password and use that with Rainlendar.
