
Unable to resolve the host

Posted by billfish - 2013/04/05 01:42

Suddenly I'm getting the error "Network Error (Google) - Server returned result (6) 0 Unable to resolve the host." I've got the Reload delay after resume and the network access delay after startup cranked up to 10000. It seems to be updating OK, but I do get the error messages.

If you get the error only on startup it means that your internet connection is not working yet at the time Rainlendar tries to read the events from Google. Try increasing the network access delay some more.

I've increased the delays to 300000 and still get this on awakening from sleep, as if there was an attempt to read the line while the computer was asleep.

Reload delay after resume (ms) 300000
Network access delay after startup (ms) 300000

Intel iMac, 10.8.3, Rainlendar 2.11.1 b129

Can you run Rainlendar in the debug mode and try to reproduce the problem? Please send the debug log to me after you get the error. You can use the Rainlendar's support email address.

Hi guys

I'm new to Rainlendar - and I get this error when my PC wakens from sleep. What was the solution in your case?

If your network is not up yet when Rainlendar tries to download the events you can delay the connection from Options->Advanced->Reload delay after resume.
