
Rainlendar and Google Sync Issues

Posted by cowboy - 2013/04/24 18:47

Using Rainlendar Pro 2.11.1

No Issues in syncing with google on adding or deleting both ways. I am having a problem on updating an event.

When you edit an existing event (update) it in rainlendar it sync's with google but creates a new event. Both the old event and edited/updated event show up as two events in google calendar.

It is not syncing up as an edit in place. Is this is a bug? Is there a work around?

Thanks

Example: On 04/24/13 create a event "TEST" with description "Testing Google" save it in rainleander, it syncs up with google calendar and event "TEST" with description "Testing Google" shows up.

Go back to rainlendar and edit this "TEST" event, change description to "Testin g Rainlendar", save it, it syncs with google calendar.

Now TWO events show up in google Calendar "TEST" & "TEST" one with desc "Testing Google" and one with "Testing Rainlendar".

There should have been only one event in google "TEST" with the latest desc" Testing Rainlendar".

Can you run Rainlendar in the debug mode and repeat the steps that show the problem. After that send the debug log to me (use the support email address and include a link to this forum thread). If you have multiple calendars enabled please disable all the others so that the log will contain only the calendar which shows the problem.
