## CalDav issue using Snow Leopard server

Posted by solo7777 - 2013/05/03 11:19

---

I would like to know the correct url to setup my CalDav account in Rainlendar. When I did try to put in the url as `https://myserver.mydomain.com` and put in my username and password (which works fine when I setup this account on my iphone, ipad and mac) I get the cannot find any calendars error. Maybe I do not have enough information in the path? Also, which method of authentication is correct?

Thank you.

I have not tried the OS X server but yes, you most likely need to define some path to the url. Apple's own products might use some non-standard way to figure out the calendar path but the server's logs will probably give some idea what the correct url should be. You can also run Rainlendar in the debug mode and check from the debug log what exactly the server is returning to Rainlendar.

If the basic authentication does not work you can try the digest authentication (I think iCloud uses that one too).
