## Deleting appointment on Google Calendar

Posted by KoenDV - 2013/05/09 05:39

---

Hi,

I use Rainlendar 2.11.1 (b129) 64 bit Pro.

When I try to delete an appointment, this is sometimes not deleted on the Google Calendar from the first time. When I try it the second time, it is deleted in most cases. I ran the debug file and this is what it said:

Google: CURLINFO\_TEXT: SSL certificate verify result: unable to get local issuer certificate (20), continuing anyway.

At that moment, the appointment is gone from the Rainlendar Calendar on the desktop, but when I reload it, the appointment is shown again because it still exists in the Google Calendar.

Can you run Rainlendar in the debug mode and send the debug log to me after the problem has occurred (use the support email address and include a link to this forum thread). If you have multiple calendars enabled please disable all the others so that the log will contain only the calendar which has the problem.

I just enabled the debug mode and suddenly everything seems to be working. I tried 10 times to add and delete an appointment, without any problem now. Strange... I'll keep an eye on it and send you a debug log when it occurs again.

Thanks anyway for responding so quickly.

Koen
