
Google calendar keeps getting disabled randomly

Posted by RUBn? - 2013/06/06 04:56

Google Calendar's "enabled" field keeps getting unset, by what it seems Rainlednar itself at random times.

I've had it for months (possibly over a year) now, but I've just missed my second appointment with all frustrations from me and my contacts of it. So, I think everyone agrees this is a big problem.

How do I pinpoint or fix this?

Thank you.

I've never heard of such problem before. You could try to enable the calendar list window so that you can see the state of the calendars on the desktop. That might help trying to figure out in what kind of situation the calendar gets disabled.

Thanks, and I did that now, but isn't there anything else you can do to find this problem? I believe it won't help me much because checking my rainlendar windows with or without the calendar list will be pretty much the same (it will just be disabled, but I can see that directly from all the lacking appointments in the standard windows). And I have been doing that for months without any pinpoint on any situation. :(

You could try to disable the shortcut keys (Options->Advanced->Disable keyboard shortcuts). Perhaps you accidentally disable the calendar when Rainlendar has keyboard focus.

Re: Google calendar keeps getting disabled randomly

Does that mean there are such keyboard shortcuts that are not defined in Options->HotKeys? If not, I don't have such hotkeys.

Re: Google calendar keeps getting disabled randomly

The Options->Hotkeys just lists your custom global hotkeys. There are lots of other build-in shortcuts too. You can e.g. toggle a calendar by pressing Ctrl+1.

Re: Google calendar keeps getting disabled randomly

I see. I didn't know that. Maybe that's my whole deal, because I have turned my computer to one huge shortcut key handler via autohotkey and it probably overlaps or might sometimes not press all the key changers (shift, ctrl, alt, etc.). (I have several global actions on the "1" key with changer-keys.)

So, where is this list of these built in keys (didn't find it in help) and can I disable just the "calendar-toggling" ones?

Thanks so far and in advance

The following description also can be found in Rainlendar Help File.

Changing months

Rainlendar shows the current month by default (the date is taken from your system). You can change to the next or previous month from the arrow buttons in the window. You can also use shortcut keys to change the months (the window must have keyboard focus):

Key -- Function

Right -- Next month

Left -- Previous month

Up -- Next year

Down -- Previous year

Home -- Current month

Ctrl + F1 -- January

Ctrl + F2 -- February

Ctrl + F3 -- March

Ctrl + F4 -- April

Ctrl + F5 -- May

Ctrl + F6 -- June

Ctrl + F7 -- July

Ctrl + F8 -- August

Ctrl + F9 -- September

Ctrl + F10 -- October

Ctrl + F11 -- November

Ctrl + F12 -- December

Windows: You can quickly hide and show the active windows from the context menu. You can also use the shortcut keys (from alt + 1 to alt + 0) to toggle the windows.

Calendars: It's possible to enable and disable the calendars from the context menu. You can use this to quickly hide/show some of the events from the calendar that don't need to be visible all the time. You can also use the shortcut keys (from ctrl + 1 to ctrl + 0) to toggle the calendars.

You can disable all keyboard shortcuts except the user defined hotkeys, from Options -- Advanced -- Disable keyboard shortcuts.

Thanks.

(After a disastrous accidental disable-behavior again, I realized I forgot to implement the advanced "disable all" from your last post. DOW!!)

Maybe also allow me some improvement-suggestions:

I noticed that ctrl-shift-1, ctrl-alt-1, etc. of which I use 3 daily, is also toggling calendar 1 (when above setting not disabled). That really shouldn't happen, should it?

It would be much better if I could disable some individual built-in hotkey(s) in stead of disabling all of them. Even better to customize them of course.

Anyway, thanks again.
