## How do I limit a birth date to a specific month?

Posted by ecbritz - 2013/06/16 00:45

---

I'm new to Rainlendar and confused because a birthday reminder set for a certain day and month is repeated every month. For instance, I would set the date of birth as 15th June. Scrolling Rainlendar forwards and backwards through the consecutive months, I notice that 15th June is marked every month. It's as if the person has a birthday on the 15th of January, the 15th of February, etc. How exactly do I set a birth date to be shown only on the 15th of June?

You can change the event to repeat yearly instead monthly in the recurrence tab.

I'm wondering, if it's possible to set the Birthday date to "unknown" year.

It means, event is shown as "Birthday" (icon, color ), however, the years are not calculated, even if "Add years after summary" checkbox is on.

Any chance to do this without adding one more event (like "Birhday\_with\_unknown\_year") ?

The category defines the events where the years are added to the title so you would have to create a second category for the birthdays. You can use the same appearance as with the build-in birthdays. The categories can be created in Options->Skins (click the categories button).

My own question was answered well and I had success the next time I tried. Thanks very much!
