
Moving tasks is very slow / hangs in Ubuntu 13.04

Posted by ezkomomo - 2013/07/20 13:03

Moving a task / to-do via drag & drop to another position takes about 20-30 seconds or hangs/freezes. I think it doesn't matter how many task items are in the list.

I'm using:

- Linux Ubuntu 13.04 with Unity, 64bit
- Rainlendar 2.11.1

There are no problems with drag & drop in Windows 7.

What skin you are using? It might be that redrawing the window takes a long time for some reason. Can you send the debug log to me? You can use the Rainlendar's support address and include a link to this forum thread.
