0 Minute Alarms Doesn\'t Work Properly

Posted by tritipsteak - 2013/07/28 16:16

_____

Hi, i'm new to this forum. And i got sort of a bit of a problem.

I don't know if this is suppose to be a Pro feature or not but it doesn't make sense if it was.

I downloaded my Google calendar ical file to be used by Rainlendar and i noticed that it DOES NOT import the 0 Minute Alarms at all; however, this does NOT apply if there's a second alarm or if it's one minute before.

For example:

I wanted to do a Sweet Sweep alarm on Google Calendar that will remind me at 11:00AM

THIS ALARM WILL NOT BE IMPORTED.

If i change it to before and then, it WILL work. Why does this happen?

I also looked at the ical file itself and it seems that any TRIGGER:P0D will NOT get recognized but any TRIGGER:-P0D will be recognized and thus, the will be seen by Rainlendar.

The only alternative way i know would be to do . But I sort of wonder if it could be POSSIBLE to do 0 minute instead so that if i accidentally did 0 minute, there wouldn't be any errors.

EDIT: Okay after further testing, it appears this ONLY happens when ALERT is set on EMAIL. If the alert is set on Pop-UP works just fine.

EDIT 2: Spoke too soon, i don't know what happened... but POP-UP or EMAIL is the same result for

==

Hmm... I tried to import tasks with alarm triggers defined as -P0D and P0D but wasn't able to reproduce the problem. Can you attach an event which has an alarm that Rainlendar cannot import.
