## ownCloud calDAV calendar

Posted by squalo - 2013/07/29 15:09

---

Hello

I'm using Rainlendar 2.11.1 b129 64bit and ownCloud 5.05 calDAV Server.

It's possible to write a new entry within rainlendar and it's posted in the ownCloud's webinterface, but it is never shown in rainlendar itself?!

No error msg pops up.

What I'm doing wrong?

It seem to be, that no calenader entries could be read from rainlendar, because posting an entry directly into ownCloud it is also not shown on rainy :(

Appreciating any hints.

BR

Please try the latest beta version and see if it has the same problem. If it does, can you run Rainlendar in the debug mode and send the debug log to me (use the support email address and include a link to this forum thread). If you have multiple calendars enabled please disable all the others so that the log will contain only the calendar which has the problem.

Meanwhile it works. The problem was, that ownCloud is running on a NAS (Synology), which had an own calDAV Server build in. Deactivating this server helped me.

But it was not possible i.e. to use this calDAV Server from Synology DSM (instead of owncloud)to run with Rainlendar. Strange.

Thanks for your hints.
