
Weather not working in 2.11

Posted by someguy9 - 2013/07/31 09:48

In my situation, I have two computers. Computer A is running Windows 7 32-bit with Rainlendar 2.8, and the weather works fine. Computer B is running Windows 7 64-bit and Rainlendar 2.11 (the 32-bit version) and the weather is stuck on "Refreshing..." I installed the 32-bit version because I had this same problem with the 64-bit version, and I thought maybe that was the variable. Turns out it's not. Any idea why this might not be working?

Check the Rainlendar's debug log. It probably has some error related to the downloading of the weather feed. If I remember correctly the lua library upgrade which was done few versions ago introduced changes which broke few skins. If this is the case you either need to find an updated version of the weather skin that you are using or try to fix the weather script yourself.
