## Can't make settings in ubuntu 13.04 64bit

Posted by Spider - 2013/08/07 09:15

---

Hi! I installed Rainlendar pro in ubuntu from the download-file You are offering. And it worked fine, included settings.

After complete new install of ubuntu I installed Rainlendar, but now I can't do the kalendar-settings. I did the skin-setting and some others, all of them with some freezing, but finally I had my skin...

But to add my google calendar for sync, the settings-panel freezes again.

I de-installed Rainlendar kompletely and reinstalled, but with same effects.

The installed-program-location is /usr/lib/rainlendar2. Is this correct? Should it be so?

Thank You for Your support!!!

It is solved somehow now. I suppose that changing monitor from digital input to analog input causes some improvements in xserver...

So ist is solved. Rainlendar is working fine again!!!
