## lua script to list month names?

Posted by darren1234 - 2013/08/31 00:52

---

anyone out there know of/how to do a lua script for a button press that will list the month names and jump to selected month?

Welcome to the forum, darren1234.

I've made 2 years ago a skin to quick change the current date showed in Rainlendar. It doesn't show the month names but the month numbers to keep it universal and not language dependent. <https://jorgeluis-jorgeluis.deviantart.com/art/QuickDate-1-0-for-Rainlendar2-202339966>

Thanks, nice solution, but that is not what I wanted as it will involve invoking a separate window, whereas I was looking for something similar to the Global\_SnoozeMenuAll() function.

Well, there is also this same option ("Choose month") in the Rainlendar's context menu. If you want a context menu for your window, you can have something like:

```
function Button_SelectMonthByName()
    index = Rainlendar_ShowMenu(-1,-1,{"Jan","Feb","Mar","Apr","May","Jun","Jul","Ago","Sep","Oct","Nov","Dec"})
    day, month, year = Rainlendar_GetDisplayDate()
    Rainlendar_SetDisplayDate(day, index-1, year)
    Rainlendar_Redraw(0)
end
```

Have changed the language from the Rainlendar options to see if it would translate the english menu items that I have used to the chosen language. No joy, though it does translate my english tooltips for 'Next month' and 'Previous month' and for 'Current month' but not for 'Current Month (right-click select month)', it also translates the event and todo list titles. :S

Rainlendar automatically translates some words/phrases if they are stored in the localizations files. "Current month" is localized but your text isn't. There isn't an extra file to add user localization. One time I talk about this with Rainy, and the (only?) solution could be detect the selected language and show the right localization by script.
