
Different setups for dualscreen

Posted by tegelane89 - 2013/09/18 05:05

When I'm using my laptop docked in the office, I have 2-screen setup where i want "Events" window and "week view" to be on left-side monitor.

But when I'm at home (docked and 2-screen setup) I would like to have "Events" window and "week view" window on right screen.

When there is no extra screens connected it would like to have no events list and week view displayed

Does anyone knows how to achieve this?

You might be able to this with a custom lua script but that would have to be created for your specific needs. The idea about different window setups is good though. I'll consider if it could be somehow integrated into the application.
