## Selected calendar in template is not saved

Posted by AndyS01 - 2013/10/23 08:58

---

I have 3 calendars defined: Common, Default and Andy (in that order). I created a template with the 'Andy' calendar specified, then saved the template. However, when the template was saved, the calendar selection was not saved.

In the .rainlendar2.ini file, the 'calendars' value was empty:

```
Name=quickadd
Summary=TIMEKEEPER
Location=
Url=
Description=
Private=1
Busy=1
Calendars=
```

When I change "Calendars=" to "Calendars=Andy", then create an event using the template, the 'Andy' calendar shows up as the calendar to be used.

Why doesn't the calendar choice of a template get saved?

The template only saves the fields which have been changed. So you need to first change the calendar selection (even if it already shows the correct calendar) and create the template only after that.

Thanks, that worked. I spent several hours on this problem, and I would call this a Rainlendar bug. Save 'just the fields that changed'? Really?
