
connect to Google Calendar

Posted by j1910 - 2013/11/10 10:17

The beta version refuses to connect to Google Calendar. But I see a new plugin.

I'm using Windows 8.1,

Both plugins still work with Google Calendar but you shouldn't use the one marked as deprecated anymore. If you are not able to connect to Google Calendar with either of them please run Rainlendar in the debug mode and send the debug log to me (use the support email address and include a link to this forum thread).

Here is the error message (Screenshoot). I have sent in "Report to Moderator" The debug file.

With Windows XP SP3, version is 2.12 (b134) 32 bit error (has connection to Google Calendar).

Here's what happens when Rainlendar tries to authenticate with the Google's server:

```
20:04:55: RBV: CURLINFO_TEXT: About to connect() to www.google.com port 443 (#0)
20:04:55: RBV: CURLINFO_TEXT: Trying 173.194.44.50...
20:04:55: RBV: CURLINFO_TEXT: Bad access
20:04:55: RBV: CURLINFO_TEXT: Trying 173.194.44.51...
20:04:55: RBV: CURLINFO_TEXT: Bad access
20:04:55: RBV: CURLINFO_TEXT: Trying 173.194.44.52...
20:04:55: RBV: CURLINFO_TEXT: Bad access
20:04:55: RBV: CURLINFO_TEXT: Trying 173.194.44.48...
20:04:55: RBV: CURLINFO_TEXT: Bad access
20:04:55: RBV: CURLINFO_TEXT: Trying 173.194.44.49...
20:04:55: RBV: CURLINFO_TEXT: Bad access
20:04:55: RBV: CURLINFO_TEXT: couldn't connect to host
20:04:55: RBV: CURLINFO_TEXT: Closing connection #0
```

I've never seen the "bad access" failure before so I'm not sure what exactly is causing it but something in your system seems to block Rainlendar from connecting to the Google's IP addresses. The usual suspects are firewall or other security software which you might have installed or perhaps a hardware router which for some reason stops the traffic.

With Rainlendar v.2.11 (b129) the connection works (screenshot attached).
Fire wall is the same, hardware is the same, roter is the same, Windows 8.1 is the same!
And Rainlendar v. 2.12 (b134) works with Windows XP.
Please see the last line of the log file in Sceenshot.

I tried this in Windows 8.1 and if I add Rainlendar to the Windows Firewall's block list I get the same error. So, you should verify that this does not happen in your system too. Note that v2.11 and the beta are different applications so even if the one has access to network it doesn't mean that the other one has it too.

Some security software also use reputation based blocking which is a real problem with beta versions since they are not used by very many people and hence their reputation is low. I don't know if Windows 8.1 has this kind of mechanism but at least if you are using any 3rd party security software you should check if this is what is happening in your system.

Thank you for Rainlendar v.2.12 (b135) 64 bit. This version takes on connection to google calendar! Thank you! I use the same Windows 8.1 and the same firewall - Norton Internet Security. The block list I have not found (it is apparently managed by Norton Internet Security).
