## Hang up or very slow start on Windows 7 x64

Posted by blackleash - 2013/12/03 05:56

---

I've got some problem, because after format Rainlendar doesn't show up on desktop and in the tray, process is started, but application shows after few minutes (not seconds) and when I change something or refresh it, it freezes and unlocks after few minutes or never... I was trying on few latest versions, on every its the same. I would post a debug info but I don't know how to start app in it.

You can enable the debug log by starting the application from the "Debug Rainlendar2" link that is in the installation folder.

There are two places where it seems to hang for 8 minutes. Right at the startup and after the refresh. The latter is especially puzzling since there isn't much happening in that place. It's weird issue in general since I've never seen such before.

Can you try the latest beta version and see if the problem happens with it too? Please convert it to portable installation so that your current settings won't be affected.
