## Problem with Google Calendar on Rainlendar PRO

Posted by Nik\_Henri - 2013/12/13 12:10

---

Rainlendar = Rainlendar PRO 2.11.1 64 bits

OS = Windows 7, 64 bits

Issue:  
I got rainlendar at my job and house. I use rainlendar pro for the google calendar feature. Everything, was working fine for the last 2-3 years but now it look like I cant add/change something in the calendar. If I had a event it disappear, if I change a event I have a 'Server returned result: (65) 302 Send the data requires a rewind that failed' error. If I had something on the google calendar on the web site, rainlendar see it, so from what I understand rainlendar can READ from google calendar but cant WRITE on it.

I just started having this problem a couple of days ago on my macbook when connected to a Google Calendar. Can't find any way to stop it. As soon as I dismiss an event, I get Warning...  
Unable to upload the event...Sending the data requires a rewind that failed

The strange thing is that if I use rainlendar on another system (same version 2.11.1) on another macbook, it's ok. from other posts, it looks like it may be related to changes that google may have made on their end.

Try the latest beta version. The issue should be fixed in it.

thx Rainy !! I'm now using Rainlendar 2.12 BETA build 135 and that fix my issue :)  
:D

yes, thx, I too now have the 2.12 beta build 135 and it works. However, now I noticed I don't have my ToDo lists anymore, but I think I now have to set them up differently with this version.

I'm having the same problem. Great to have GCal syncing back, but I hope my ToDo list comes back. I can't even find the option for it anymore.

I found that you now have to set the Google Task (ToDo) Lists up separately from Calendars. If you go into Rainlendar2 Options->Calendars, you'll see a new type that you can add called Google Task. You set it up just like a Google Calendar, but the list is separate now.

Has anybody noticed a problem with Google Calendars dealing with time-zones. It appears that when you create a new event on a Google Calendar through Rainlendar2, the time-zone information doesn't get set. It appears that Google is interpreting the Rainlendar2 event as GMT time instead of using whatever the local time-zone locale info is on the device you're using at the time.
