
Loading offline calendar on startup.

Posted by Flamefire - 2013/12/16 05:41

The network connection needs a bit time to startup so rainlendar fetches data a few seconds after the start (which in my case are 15s) During this time the calendar is empty.

Suggestion: Make rainlendar load the offline copy that it already creates (if checked) right after startup and sync it with the online version when available.

PS: Make the delay in the settings in seconds rather than milliseconds. Looks better.

It should do that already but there seems to be a timing problem so this doesn't always (or ever) happen. I'll try to fix it.

My Calendar never loads without an internet connection which can be a pain as I live in a remote area where often there is no connection. any way of changing this?

Have you enabled the offline copy feature for the calendar?
